Installation Guide
For Grassed Surfaces

BODPAVE®85 Installation Method

1. Install edge retention as specified: Either tanalised timber boards, concrete, steel or plastic curbs, or other as appropriate.
2. Ensure that the sand:soil rootzone bedding layer is the correct and uniform thickness, is level and well consolidated.
3. Place the paver units: With the two sets of edge loop connectors facing in directions of laying, place BODPAVE 85 pavers firmly onto the surface so that its ground spikes are pressed fully into the bedding and the base of the paver cells sit flat on the bedding layer surface. Connect adjacent pavers together by slotting the edge cell connectors down into the edge loops (LOOPS ALWAYS LEAD) and progress over the area in rows. Pavers are locked in place by snap-fit clips. If paver separation is required, clips can be dislocated using careful, firm hand or screwdriver pressure or by gently twisting the paver joints. Use protective gloves to avoid abrasions.
4. Pavers can be offset by one cell increments or cut to fit around obstructions and curves using a hand or power saw. The use of cut-pieces which do not have integral snap-fit connectors should be avoided wherever possible.
5. Fill pavers with specified rootzone to finished levels: 0.25” below top of the cells after settlement. A light plate compactor may be used to consolidate the pavers and settle rootzone fill. Do not overfill or over consolidate.
6. Carry out a normal seeding, fertilizing and watering program. A light top dressing may be applied to just cover the seed and to provide adequate germination conditions. Do not overfill the paver cells. Thin-cut or Washed Turf may be lightly rolled into the surface as an alternative if required.
7. The surface may be trafficked immediately for critical access purposes, but it is preferable to allow grass to fully establish prior to use.

Design Notes

Note 1: A class 5 road sub-base may be used provided that installation has adequate drainage. Alternatively, a permeable/open-graded(reduced fines) sub-base layer (i.e reduced fines class 7) may be specified, e.g. as part of a LID/NPDES system for stormwater control.

Note 2: Advised separation layer of TYPAR Geotextile 3401 to be installed between sub-base and bedding layer

Note 3: If construction traffic axle loads will be greater than (approx 6.5 Tons), minimum sub-base thickness shall be 6”. Maximum sub-base particle size should match minimum sub-base thickness but not exceed 3” diameter.

Note 4: A geogrid may be used below sub-base layer to provide additional strength or reduce sub-base depth. Contact TYPAR Technical Sales for assistance.

Note 5: Specific advice on CBR% strengths, ground conditions and construction over weak ground with a CBR less than 1% is available from TYPAR Geosynthetics Technical Sales. CBR% = California Bearing Ratio, a measurement of subgrade soil strength

Note 6: Where an open-graded ‘reduced fines’ sub-base is specified for LID/NPDES applications, the sub-base should be wrapped with TYPAR geotextile fabric to avoid the bedding layer or sub-grade soils from leaching into the sub-base.

Note 7: Optional drainage may be required under impermeable soil conditions. Contact TYPAR Technical Sales for assistance.

Note 8: Drainage for a LID/NPDES application will vary according to the site but generally omits the requirement for extensive pipe and trench drainage systems with an open-graded sub-base layer.

Note 9: Rootzone bedding and paver fill must be a free-draining, structurally sound blend of sand:soil or sand:compost such as used in sports/golf construction and normally identified as a 60:40 or 70:30 ratio blend. The use of site-won materials or in-situ self-blending is NOT recommended without taking further advice from TYPAR Technical Sales.

Note 10: Maximum advised gradient for traffic applications: 12% (18°) 7°. BODPAVE 85 pavers have specific pegging points if required for steep slope applications. Pegging is not necessary for standard applications.

Specific advice on the use of BODPAVE®85 pavers on steep slopes, drainage suitability, soil suitability and LID/NPDES systems for water drainage applications, can be obtained from TYPAR Technical Sales.
Installation Guide For Grassed Surfaces

Typical Construction Profile

- Bodpave85 paver cells filled to within 0.25" of the surface with 60:40 rootzone then seeded or turfed and fertilized
- Optional vertical edging board or curb
- Separation layer: TYPAR 3401 Geotextile fabric (Note 2, 6)
- Bedding layer: 2"-2.75" thick consolidated 60:40 rootzone
- Sub-base layer: Thickness (T) & Type as determined by Table 1
- Subgrade Soil (subsoil) (Refer to Table 1, Chart 1)
- Stabilization: Optional geogrid (Note 4)
- Separator: Optional TYPAR Geotextile (Note 6)

Table 1: Typical Sub-base Thickness (Tx) Requirements

<table>
<thead>

Table 2: Materials Specification

- Bedding Layer: 60:40 rootzone: 2" - 2.75" thick
- Paver fill (seed bed): 60:40 rootzone 1.75" thick
- Grass seed or turf: 0.01 lbs/ft² amenity blend low maintenance seed or turf as required
- Fertilizer: Pre-seed fertilizer followed up with appropriate seasonal fertilizer
- Sub-base type: Class 5 road base or a modified permeable reduced fines class 7 sub-base (Table 1)
- Sub-base reinforcement: TYPAR Geotextile (Table 1) or geogrid Specification upon request
