Surface Overcoating

PorousPave
PERMEABLE • DURABLE • FLEXIBLE

 WHY OVERCOAT? 
Over time, in heavily used areas, the surface of any porous pavement can show signs of wear. Proper maintenance will certainly prolong the life of Porous Pave. Applying a top coat of binder will restore the surface to “like new” condition.

APPLICATION
Porous Pave B5HN binder can be thinned and applied either by roller or, preferably, an airless sprayer. The binder must be thinned with mineral spirits prior to applying! Application of straight binder will be too thick and will not work.

Using a roller in small areas is adequate however in larger areas a sprayer will provide a better, more consistent coverage.

PREPPING THE SURFACE
• Be sure to blow/sweep the surface of the Porous Pave prior to applying the binder.
• Make sure all leaves, sticks, stones and other surface debris are removed before application.

THINNING THE BINDER
Mix one gallon of mineral spirits into one five gallon pail of binder. Stir consistently until mineral spirits mix with the binder.

Initially the mineral spirits will sit on top of the thicker binder. However, after approximately 30 seconds of mixing, the mineral spirits will mix into the binder creating a thin, easy to apply material.

CAUTION
When applying binder with a sprayer it is imperative that all skin be covered and a mask is worn. The binder is very sticky and a small amount of airborne mist will be created from the sprayer.

Approximate coverage per pail
Spray Applied
400-650 square feet
Roller Applied
250-450 square feet

SPRAKER APPLICATION

ROLLE APPLICATION

ALWAYS follow all safety precautions found in the binder MSDS sheet at www.porouspaveinc.com
